COMPUTED TOMOGRAPHY - CHEST WITHOUT IV CONTRAST

Synthetic case: DEMO-RAD-4406 | Examination: 2026-07-08 | Comparison: CT 2025-11-19
Clinical indication: persistent cough; prior small pulmonary opacity described in outside note.
Dose information: omitted from this synthetic narrative fixture.

TECHNIQUE

Axial noncontrast images with coronal and sagittal reformats. Evaluation of pulmonary arteries is limited without intravenous contrast. This examination was not performed as a pulmonary angiogram.

FINDINGS

Lungs and airways: A 7 mm subpleural ground-glass opacity is present in the left upper lobe (series 4, image 82), not clearly changed from the outside study given differing technique. This may represent focal inflammation or an indolent process. No dense focal air-space consolidation is seen. Mild dependent linear atelectatic change is present at both bases. Central airways are patent. No pleural effusion or pneumothorax.

Mediastinum: No enlarged mediastinal lymph node by size criteria. Cardiac size is within expected
limits. No pericardial effusion. Mild coronary arterial calcification is noted.
Upper abdomen: Limited images show no acute finding in the visualized portions.
Bones: Mild multilevel degenerative change. No acute osseous abnormality identified.

COMPUTED TOMOGRAPHY - CHEST WITHOUT IV CONTRAST

IMPRESSION

1. 7 mm left upper-lobe subpleural ground-glass opacity. Stability is uncertain because the prior
comparison used a different technique. It may be inflammatory; an indolent lesion cannot be excluded from this examination alone.
2. No dense air-space consolidation, pleural effusion, or pneumothorax.
3. Mild coronary arterial calcification.

RECOMMENDATION

Correlate with prior imaging if available. Follow-up interval imaging may be considered according
to the treating clinician's assessment and applicable local protocol. This report does not state that a follow-up study has been scheduled.

COMMUNICATION

No urgent unexpected finding requiring direct communication is documented in this synthetic case.
Interpreting service: Fictional Diagnostic Imaging Group.

END OF REPORT - Synthetic educational test fixture; not a real patient record.
